  pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB

F:49,71,178/Binding site: zinc, car
A;Description: catalyzes the oxidation by NAD+ of formaldehyde and glutathione to S-form C;Superfamily: alcohol dehydrogenase; long-chain alcohol dehydrogenase homology C;Keywords: acetylated amino end; alcohol metabolism; dimer; metalloprotein; NAD; oxidor F;2-379/Product: alcohol dehydrogenase Fdh #status predicted <MAT>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       alcohol dehydrogenase (EC 1.1.1) Fdh - fruit fly (Drosophila melanogaster)
N.Alternate names: class III alcohol dehydrogenase
N.Contains: formaldehyde dehydrogenase (glutathione) (EC 1.2.1.1); octanol dehydrogenase
C.Species: Drosophila melanogaster
C.Accession: S51357

A;Description: catalyzes the oxidation of primary and secondary alcohols to aldehydes C;Function: <PDH>
A;Description: <PDH>
A;Description: catalyzes the oxidation by NAD+ of formaldehyde and glutathione to S-f C;Superfamily: alcohol dehydrogenase; long-chain alcohol dehydrogenase homology C;Keywords: acetylated amino end; alcohol metabolism; homodimer; metalloprotein; NAD; F;2-374/Product: alcohol dehydrogenase 2 %status predicted <MAT>
F;30-365/Domain: long-chain alcohol dehydrogenase homology <LADH>
F;194-223/Region: beta-alpha-beta NAD nucleotide-binding fold f;22/Modified site: acetylated amino end (Ala) (in mature form) #status predicted F;45,67,174/Binding site: zinc, catalytic (Cys, His, Cys) #status predicted F;97,100,103,111/Binding site: zinc, noncatalytic (Cys) #status predicted
A;Description: catalyzes the oxidation by NAD+ of formaldehyde and glutathione to C;Superfamily: alcohol dehydrogenase; long-chain alcohol dehydrogenase homology C;Keywords: alcohol metabolism; dimer; metalloprotein; NAD; oxidoreductase; zinc E;2-376/Product: alcohol dehydrogenase class III #status predicted <MAT> F;32-367/Domain: long-chain alcohol dehydrogenase homology <LADH> F:196-225/Region: beta-alpha-beta NAD nucleotide-binding fold E;47,69,176/Binding site: zinc, catalytic (Cys, His, Cys) #status predicted F;99,102,105,113/Binding site: zinc, noncatalytic (Cys) #status predicted

A;Title: Evidence for the identity of glutathione-dependent formaldehyde dehydrogenase & A;Reference number: S06633; MUID:90033321

A;Accession: S06633; MUID:90033321

A;Status: preliminary

A;Molecule type: protein
A;Residues: 9-25,84-95,'X',97-98,'X',187;188,189-193,'X',195-198;357-365 <KOI>
A;Experimental source: strain Wistar
C;Comment: Class III alcohol dehydrogenases are pyrazole-insensitive, are not very active.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C;Accession: $00331; $02619; $06633

NYALCETHALE Halmess Clades III accounce dehydrogenase (glutathione) (EC 1.2.1.1)

C. Species: Escherichia coli
C. Species: Escherichia coli
C. Pate: 10-Jul-1992 #sequence_revision 01-May-1998 #text_change 11-Jun-1999
C. Accession: SS7525
R. Kuemmerle, N.; Feucht, H.; Kaulfers, P.M.
submitted to the EMBL Data Library, June 1993
A. Description: Plasmid-mediated formaldehyde-resistance in E. coli: nucleotide sequence A: Reference number: S57525
A: Molecule type: DNA
A: Residues: 1-369 <KUE>
A: Residues: 1-369 <KUE>
A: Residues: 1-369 <KUE>
A: Compent: Cluss III alcohol dehydrogenases are pyrazole-insensitive, are not very active (Complex: homodiner Cluss III alcohol dehydrogenases are pyrazole-insensitive, are not very active (Complex: homodiner Cluss III alcohol dehydrogenases are pyrazole-insensitive, are not very active (Complex: homodiner Cluss III alcohol dehydrogenases are pyrazole-insensitive, are not very active (Complex: homodiner catalyzes the oxidation of primary and secondary alcohols to aldehydes are C: Function: <ADH>
A: Description: catalyzes the oxidation by NAD+ of formaldehyde and glutathione to S-form C: Superfamily: alcohol dehydrogenase; long-chain alcohol dehydrogenase homology (Complex: Complex: chain alcohol dehydrogenase homology (Complex: Complex: 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Alcohol dehydrogenase (EC 1.1.1.1) C - Escherichia coli (isolate VU N;Alternate names: class III alcohol dehydrogenase N;Contains: formaldehyde dehydrogenase (glutathione) (EC 1.2.1.1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A:Doscription: catalyzes oxidation by NAD+ of formaldehyde and glutathione to S-formylgl C:Superfamily: alcohol dehydrogenase; long-chain alcohol dehydrogenase homology C:Keywords: alcohol metabolism; homodiner; metalloprotein; NAD; oxidoreductase; zinc F:25-360/Domain: long-chain alcohol dehydrogenase homology <LADH> F:189-218/Region: beta-alpha-beta NAD nucleotide-binding fold F:40,62,169/Binding site: zinc, catalytic (Cys, His, Cys) #status predicted F:92,95,98,106/Binding site: zinc, noncatalytic (Cys) #status predicted

A;Description: Catalyzes the oxidation of primary and secondary alcohols to aldehydos C;Function: cFDH>
A;Description: catalyzes the oxidation by NAD+ of formaldehyde and glutathione to S-f
C;Superfamily: alcohol dehydrogenase; long-chain alcohol dehydrogenase homology
C;Keywords: acetylated amino end; alcohol metabolism; homodimer; metalloprotein; NAD;
F;1-373/Product: alcohol dehydrogenase chi chain #status experimental <mary
F;29-364/Domain: long-chain alcohol dehydrogenase homology <LADH>
F;193-222/Region: beta-alpha-beta NAD nucleotide-binding fold
F;14Modified site: acetylated amino end (Ser) #status experimental
F;44,66,173/Bidding site: zinc, catalytic (Cys, His, Cys) #status predicted
                                                                                                                                                                                                                                             A; Molecule type: protein
A; Residues: 1-373 <KAI>
C; Comment: Class III alcohol dehydrogenases are |
C; Complex: homodimer; does not form heterodimers
C; Function: <ADH>

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                     DB

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM8642-AAM42213) with nootropic, inmunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathles and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; nootropic; immunosuppressant; cytostatic; gene therapy; cance poripheral nervous system; neuropathy; central nervous system; CNS; Alzehaner's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;

                                                                                                                                                                                                                    CC AAX40826 to AAX41093 represent 5' expressed sequence tags (ESTs) for CC human secreted proteins, and encode the proteins given in AAY01602 and CC AAX11994 to AAX12260, respectively. The proteins given represent the CC signal peptide and an N-terminal fragment of a secreted protein. The CC nucleic acid sequences can be used for producing secreted human gene CC products. They can also be used to develop products for diagnosis and CC therapy. The proteins obtained may have cytokine activity, cell CC proliferation/differentiation activity, haematopoiesis regulating CC activity, tissue growth regulating activity, reproductive hormone CC regulating activity, chemotactic/chemokinetic activity, haemostatic and CC thrombolytic activity, receptor/ligand activity, anti-inflammatory CC activity, tumour inhibition activity and activity, anti-inflammatory CC can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter CC sequences. The nucleic acids encoding the signal peptide can be used on the care of the corresponding promoter CC activity activity acids encoding the signal peptide can be used on the care of the corresponding promoter CC activity activity acids encoding the signal peptide can be used on the care of the corresponding promoter CC activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity

cells they are expressed in, such as: antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; antibacterial; endocrine; cardiant; central nervous system; virucide; antibacterial; endocrine; cardiavascular; antianaemic; antiaggregant; haemostatic; vulnerary; antidiabetic; osteopathic; dermatological; antiallergic; antiastimatic; antidiabetic; cytostatic; neuroprotective; antidepressant; noctropic; antidiabetic; cytostatic; neuroprotective; antidepressant; noctropic; antidiaparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production, The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic disorders, autoimmunity, genetic diseases, haematopoietic disorders, and protein and fungal infections.

anaemia, platelet disorders,

thrombocytopaenia,

AAH99166 to AAH99904 encode the human proteins given in AAM25225 to AAM25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory; antirheumatic;

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activing inhibin activity, chemotractic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

                                                                                                                                                                                                                                                                                                                                                                           commutations in the new penes. Specific uses are described for each of the camount of the new genes. Specific uses are described for each of the client of the new genes. Specific uses are described for each of the client of the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of compositive disorders, cancer, tumours, foetal and developmental compositive disorders, diseases of the immune system, cardiovascular disorders (e.g., rheumatoid arthritis), inflammation, comparison's disease), cognitive disorders, schizophrenia, asthma, comparison's disease), cognitive disorders, schizophrenia, asthma, comparison's disease), cognitive disorders, schizophrenia, asthma, comparison, comparison, sepsis, diabetes, atherosclerosis, cardiovascular disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound comparison, to maintain organs before transplantation, for supporting due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties.

Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and induspostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human constructed protein fragment referred to in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the human cerebellin-2 of the invention. The cerebellin-2 protein may be administered to treat or prevent neurological disorders associated with the inappropriate expression of cerebellin-2 proteins and disruption of the synapse function. These disorders include Parkinson's disease, Alzheimer's disease, affective disorders (both bipolar and unipolar disorders), schizophrenia, olivopontocerebellar atrophy, Shy-Dager syndrome and other disorders caused by disruption of synapse function. Cerebellin-2 may also be used as an antigen in the production of vaccines and antibodies specific for the protein and in assays to identify agonists and other antagonists of cerebellin-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated cerebellin-2 related polypeptides useful for treating neurological disorders such as Parkinson's Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Barnes MR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC AAC97991 to AAC98763 encode the human colon cancer associated proteins, CC called human colon cancer antigens, given in AAB53234 to AAB54006. The CC human colon cancer antigens can have cytostatic, cardioactive, muscular; CC encurprotective, immunomodulatory, gynaecological, gastrointestinal, CC vulnerary, nephrotropic, antiinfective and antibacterial activities, and CC can be used in gene therapy. The colon cancer antigen polynucleotides, CC proteins and antibadies to the proteins are useful for the prevention, CC treatment and diagnosis of colon disorders, such as colon cancer. The CC polynucleotides may be used in diagnostics and research, such as for CC chromosome identification, and as hybridisation probes. The proteins CC may also be used to prevent diseases such as neural disorders, immune CC gastrointestinal disorders, wounds, renal disorders, infectious CC diseases, and cardiovascular disorders. AAC98764 to AAC98772 and CC AAB54007 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                            nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, haematopoiesis regulating activity, receptor/ligand activity, anti-inflammatory activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into
                                                                                                                                                                                                                                                                                                                                           human secreted proteins, and encode the proteins given in AAV01602 ar AAV11994 to AAV12260, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene

                                                                                                                                                                                                                          organism is used for large-scale fermentation of L-scrine for amino acid mixtures which are used in pharmaceuticals, Chemicals and cosmetics. The present sequence represents a mutant 3-PGDH protein, also known as serA, and is used in the course of the invention.
                                                                                                                                                                                                                                                                 The specification describes a coryneform bacterium which is able produce L-serine. The activity of at least one phosphoserine phosphoserine transaminase is enhanced in the organism. The

                                                                                                                                                                                                                                                                                                                                                                       mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. The are useful for identifying the mutation point of a gene derived from a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    C (3-PGDH) of Brevibacterium flavum AJ13327, a mutant strain obtained by chemical mutagenesis of B. flavum AT23327, a mutant strain obtained by chemical mutagenesis of B. flavum ATCC 14067. This mutant cenzyme has Lys at position 325 replacing the Glu residue of the wild-type enzyme (see AAV31649). The invention provides a method of producing L-serine, potentially on an industrial scale, using a coryneform bacterium having resistance to azaserine or beta-(2-thionyl)-DL-alanine, and L-serine productivity. Such bacteria produce a 3-PGDH in which feedback inhibition by L-serine is desensitised. An example is the mutant 3-PGDH produced by B. flavum AJ13327. A claimed method of producing L-serine comprises cultivating a coryneform bacterium having L-serine productivity, or a beta-(2-thionyl)-DL-alanine and having L-serine productivity, or a coryneform bacterium which harbours recombinant DNA coding for the

                                       The specification describes a coryneform bacterium which is able to produce L-serine. The activity of at least one phosphoserine phospha and phosphoserine transaminase is enhanced in the organism. The organism is used for large-scale fermentation of L-serine for amino acid mixtures which are used in pharmaceuticals, chemicals and cosmetics. The present sequence represents 3-PGDH protein, also known cosmetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents wild-type D-3-phosphoglycerate dehydrogenase (3-PGDH) of Brevibacterium flavum ATCC 14067. The invention provides a method of producing L-serine, potentially on an industrial scale, using a coryneform bacterium having resistance to azaserine or beta-(2-thienyl)-DL-alanine and L-serine productivity. Such bacteria produce a 3-PGDH in which feedback inhibition by L-serine is desensitised. An example is the mutant 3-PGDH (see AAV31650) produced by B. flavum AJI3327, which has the glutamic acid residue at amino acid position 325 replaced by lysine. A claimed method of producing L-serine comprises cultivating a coryneform bacterium having resistance to azaserine or beta-(2-thienyl)-DL-alanine and having L-serine productivity, or a coryneform bacterium which harbours recombinant DNA coding for the mutant 3-PGDH.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the N-terminal portion of the D-3-phosphoglycerate dehydrogenase (3-PGDH) of Corynebacterium glutamicum strain K82 (FERM BP-2444), as deduced from the nucleotide sequence of PCR-amplified K82 DNA (see AAX87798). PCF primers (see AAX87799 and AAX87800) based on the amplified K82 DNA used in the amplification of Brevibacterium flavum 3-PGDH sera gene sequences. The invention provides a method of producing L-serine, potentially on an industrial scale, using a coryneform bacterium having resistance to azaserine or beate-(2-thienyl)-DL-alanine and L-serine productivity. Such bacteria produce is 3-PGDH (see AAX31650) in which feedback inhibition by L-serine is
